Collision

Only make a collision object for complex items. If a simple Unity box or sphere will do then it is cheaper to use that rather than custom collision objects.

When making a collision make it as simple as possible for your object, the least amount of polys you can get away with the better.

If you are unsure of how that item will be used in-engine then check before making the collision for it.

When the collision object has been made name it the following

BrandName_ItemName_Collider.FBX

Then put it in the relevant folders.
